WiseDetector

Detect anything you want with the new WiseDetector

- User-defined object detection
- Easy to set-up
- Supported by P series AI cameras
- License Free

WiseDetector

The WiseDetector is a Machine Learning Model (ML) where the user can train a model to detect a user-specific object. The WiseDetector consists of two main Components: The Device Manager and the WiseAI Application.

1. **Device Manager:** A Free **Hanwha** application that help scan and configure **Hanwha**'s IP devices

Training the WiseDetector Model to detect a specific object using the WiseDetector option in the Wisenet Device Manager

2. **The WiseAI Application:** Is an application that contain the AI detection and the video analytics

Where the fully trained and configured WiseDetector model will be running within the WiseAI application (this application will be running on the **Hanwha** IP P series camera)

Simple and easy to use

1 Object training

In this step, the user uses the WiseDetector option in the Device Manager software to start the training process. The user must select a variety of sample images of the object of interest from the target camera that will be used to detect the user-specific object.

Training Steps:

1. In the Device Manager, "Right Click" on the target camera and select WiseDetector.
2. Create a new object, the object name can't include spaces or special characters.
3. Click Snapshot when you see the target object and draw with the mouse a bounding box around the object.
4. Make sure the bounding box is exactly containing the object (not too small or too big).
5. Click the train button.
6. Repeat these steps till the results are satisfactory.

The WiseDetector Model will also show the results of the training every time a new samples has been added to the training to observe the results of the training before uploading the WiseDetector model to the camera. Once the user is satisfied with the results, then we can move to the next step.

2 Color filtering and Sensitivity level (Optional)

Color: The WiseDetector enhances the detection results by offering an optional color filter for up to two colors of the object, so if an object with a different color is present in the field of view, it will be filtered out.

Sensitivity: The WiseDetector will also offer the user the option to increase or decrease the accuracy of the detection of the model. Note: Color detection will not work during Day/Night mode since the camera will only be generating a black and white image.

Simple and easy to use

3 Uploading data into P series AI cameras

After the training and configuration of the WiseDetector model, the user can upload the WiseDetector model to the WiseAI application on a compatible camera.

Once the WiseDetector is uploaded to the WiseAI application, the detections and metadata generated from the WiseDetector can be used to trigger any of the video analytics rules like line crossing, loitering, etc.

Essentially WiseDetector will function as one of the regular AI detection on the WiseAI application.

Guidelines

- The user-specific object has to be the same shape and size to be detected successfully. Therefore, an object that changes shape or size would result in inaccurate detection.
- Please note that changes in object size or object occlusion will impact the detection accuracy. Also, during the training, the user must include sample images of the object in the same environment the accurate live detection will take place, like light conditions (at night, day, shade,etc.), environment (rain, snow,etc.), and background scenery.
- The target camera must be a compatible camera with the appropriate firmware and installed in the correct location with the FoV already configured, as any changes in the camera position of fov after uploading the WiseDetector model to the camera in question will result in inaccurate detection.
- Up to two separate WiseDetectors can be uploaded to P-AI cameras.
- The trained WiseDetector model can be reused for another camera but the user must include training samples for the other camera to be included during the training.

P Series AI cameras with WiseDetector

WiseDetector is dedicated to P series AI cameras under the WiseAI application and co-exists with the included AI detection of existing P series cameras. Each P series AI Camera can be linked up to WiseDetector after installation of the appropriate firmware.
